

PRP for Dry Eyes

Dry Eye causes some serious discomfort for patients — beginning with mild irritation to eye-pain to burning sensations. The major problem with artificial tears and gels is that they don't last long enough. There are a variety of other treatment options like thermal pulsation, IPL and probes to open up the Meibomian Gland Duct, none offers a generic sure-fire long term solution. Except this one treatment is getting a surprising amount of traction — PRP Serum Drops.

Platelet-Rich Plasma for Dry Eyes

It seems human tears are full of growth factors including cytokines, albumin and vitamins. The artificial tears and gels try to mimic this constitution but is nowhere near as effective. That's when someone decided to try applying Platelet-Rich Plasma instead. Not only it is made of similar content as the natural tears, but it also has no preservatives, stabilizers and additives found in the artificial stuff. And boom, it WORKED!

Patient Testimonial "After 3 weeks of 30% PRP concentrate twice a day, and after discontinuing all other medications, she noted some improvement. After 8 weeks she was able to return to contact lens wear and her outdoor activities. She has remained free of discomfort 2 years after discontinuing the PRP."

Justifiable out of pocket costs

My PRP system can produce a three-month supply of Eye-PRP drops. It can cost \$300 for a patient, which like any other eye-drop medications, are not covered by medical insurance. This is often a barrier for a patient. Over the long term though, the results like the one we mentioned above are priceless. Not only are they able to discard other OTC eye drops, but they eventually dropped Eye-PRP as well and remained symptom-free for years.

Truth is, if you have long term dry-eye symptom, it'd be foolish not to try E-PRP. We'd all want the speedy recovery we need. But for many Americans, this little out-of-pocket medical cost can be an insurmountable wall.

Cost

\$300 (eye drops made from one vial of PRP)

One vial should last approximately 3 months

Treatment time is 3-6 months

Many people will remain symptom free for years following PRP treatment
